# FAST TURNAROUND **3D Modeling and Rapid Prototyping**

### SolidWorks modeling · 3D printed prototyping

#### MODELING AND 3D PRINT

## Optimized for Rapid Prototyping

Complimentary quick-turn mockups produced by by Glenair: 28-layer rigid flex, and 12-layer multibranch rigid flex HD Stacker board-to-board connector/flex mockup

3D MODELING OF BOX BUILDS FOR OPTIMAL INTEGRATION OF I/O INTERCONNECTS AND FLEX CIRCUIT ASSEMBLIES

- Customer-supplied STEP file of box with panel cutouts
- Glenair value-added 3D model with connector size and flange modifications

In this example, customer supplied a STEP file of a box enclosure with existing panel cutouts. The Glenair engineering team used SolidWorks to design a specially-modified connector flange, enabling the use of a smaller, higher-density connector, for significant size-and weight-savings.

- Electronic box builds are supported by software-based design and prototyping of I/O connectors and integrated flex circuits
- Process leads to optimized location and routing of internal assembly and I/O interface

This integrated system enclosure, complete with printed circuitry, I/O connectors, and power modules was designed and modeled in SolidWorks prior to production manufacturing.

### Typical design and production process

#### GLENAIR INTEGRATED PCB/FLEX ENGINEERING

The **mechanical schematic design** process typically takes one of two forms: either the customer presents a fully-realized mechanical design, or as is often the case, the process begins with a "napkin sketch" of the project. Here is an example of just such a rough design that kicked off a rigid-flex circuit assembly development process.

### From Concept to Design

Glenair engineers utilized our Altium software to create a functional and problem-free mechanical design for customer review and modification prior to starting the build.

	WIRING DIAGRAM	
P1	F	2
1	RED 24 AWG	1
5	WHT 26 AWG	5
8		8
4	BLK 24 AWG	4
9	BLU 26 AWG	7
10		3
6	DRAIN WIRES	6
7	VIO 26 AWG	9
3		0
2		2
Ļ	i	1
L_		j

**Electricals:** The next step is to define the electricals. To approximate layer count, we need a wiring diagram "schematic" complete with signal types, currents, and shielding requirements. This is also used to determine ROM pricing. In this project, work to this point was completed in just 3 weeks. With the final design approved, we were ready for production manufacturing.

Validation test requirements: Glenair offers complete generation of PCB/flex fabrication data packages including component-level documentation. Most flex customers specify validation testing as a required part of the documentation package. Tests may include DWV/IR, continuity, impedance (eye pattern), and others.
